

Assignment No 02

Submitted By: Mumtaz Ali

Submitted To: Sir Usman Shahid

Roll Number: SP21386

Subject: Professional practices

Section: BSSE-8-Afternoon

Date: 10/May/2026

Q1. Identify Ethical Issues

- **Lack of Data Encryption:** The system stores sensitive patient information such as CNIC and medical history without proper encryption. This puts patient privacy and confidential data at risk.
- **Ignoring Security Testing:** The team leader asks Ali to skip security testing in order to meet the deadline. This can lead to software vulnerabilities and possible cyberattacks.
- **Plagiarism and Copyright Violation:** Some code has been copied from an online repository without proper attribution. This violates intellectual property rights and professional ethics.
- **Incorrect Patient Reports:** The system sometimes generates incorrect patient reports, which may affect medical decisions and endanger patients' lives.
- **Hiding Problems from the Client:** The company plans to deploy the system without informing the hospital about the known issues. This is dishonest and unethical.

Q2. Apply ACM Code of Ethics

Issue	ACM Principle	Violation Explanation
Unencrypted Patient Data	Respect Privacy	Sensitive patient information is not protected, violating user privacy and confidentiality.
Ignoring Security Testing	Avoid Harm	Skipping testing can expose patients and hospitals to security risks and system failures.
Copied Code Without Attribution	Give Proper Credit for Intellectual Property	Using code without credit is plagiarism and violates intellectual property rights.
Incorrect Patient Reports	Public Good and Avoid Harm	Incorrect medical reports may cause wrong treatments and harm patients.
Hiding Issues from the Client	Honesty and Trustworthiness	The company is acting dishonestly by not informing the client about serious issues.

Q3. Recommended Actions

Ali should report the issues to higher management or the company's ethics committee. He should document the problems clearly and explain the possible risks to patient safety and

privacy. Ali should also encourage the team to fix the issues before deployment. According to professional ethics, protecting public safety and honesty is more important than personal job security. By reporting the issues responsibly, Ali would be acting ethically and professionally.

Q4. Consequences Analysis

- If Ali ignores the issues:
 - Patient data may be leaked or hacked.
 - Incorrect reports could harm patients and lead to wrong medical treatments.
 - The company may face legal action and lose its reputation.
 - Ali may feel guilty for remaining silent about unethical practices.
- If Ali reports the issues:
 - The company may fix the problems before deployment.
 - Patient safety and privacy will be better protected.
 - Ali may face pressure from management, but he will act ethically.
 - The company can improve trust and software quality.

Q5. Personal Reflection

If I were in Ali's position, I would report the issues in a professional and respectful manner. Healthcare systems directly affect human lives, so security, accuracy, and honesty are extremely important. Although reporting the issues may create challenges, following ethical principles and protecting patients would be the correct decision.
