

Software Process Improvement –SEPI-471

SPI FRAMEWORK

DR. NARGIS FATIMA

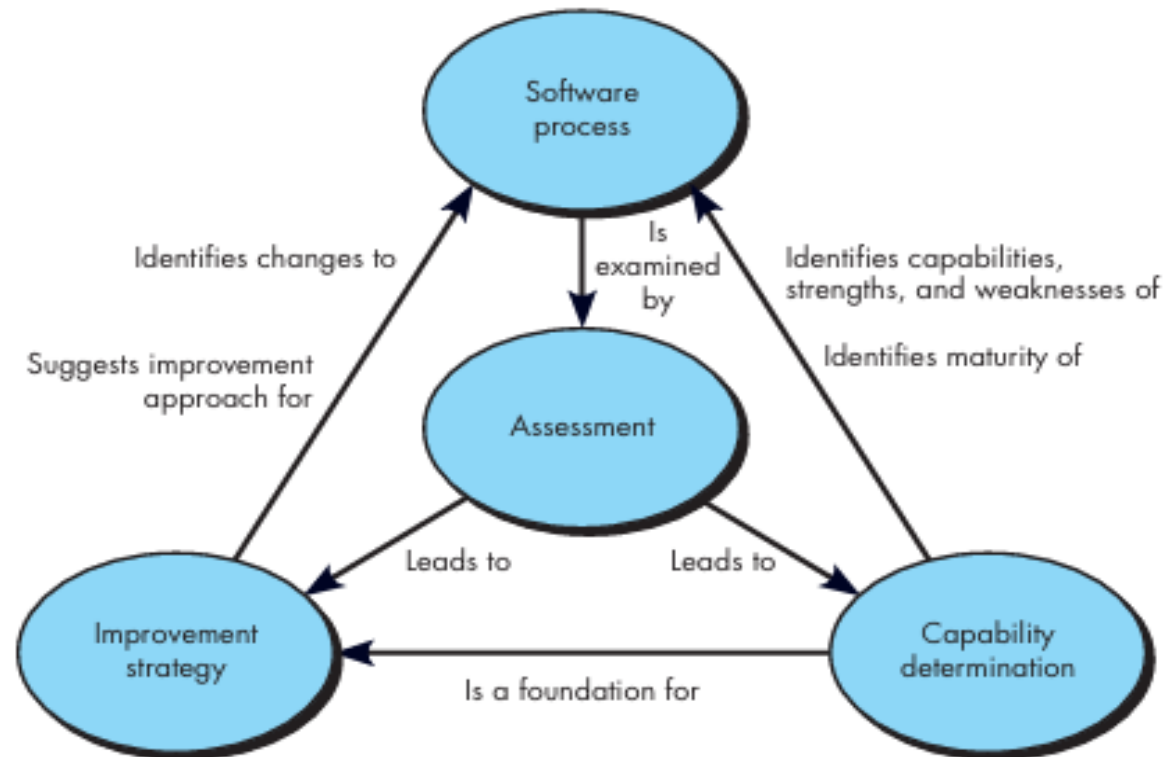

ASSISTANT PROFESSOR

DEPARTMENT OF SOFTWARE ENGINEERING , FEC

SPI Framework

- An SPI framework assesses the “maturity” of an organization’s software process and provides a qualitative indication of a maturity level.
- In fact, the term “maturity model” is often applied.
- In essence, the SPI framework encompasses a maturity model that in turn incorporates a set of process quality indicators that provide an overall measure of the process quality that will lead to product quality.

SPI Framework

The lecture slides are for reading purpose not allowed to upload on internet/website

Software process used by an organization is first examined through an assessment.

The assessment analyzes how the process is performed and helps identify its strengths, weaknesses, and maturity level.

Based on the assessment results, capability determination is conducted to evaluate the organization's ability to effectively perform software development activities and determine the maturity of the process.

The findings from the assessment and capability determination then lead to the development of an improvement strategy, which suggests methods and actions to improve the existing process.

This strategy identifies necessary changes to the software process, helping organizations enhance efficiency, quality, and performance. The improved process is then reassessed, creating a continuous cycle of evaluation and improvement

Thank you
