Pizza Vegetariana

Pizza Margherita

Pizza Bufala

1. Create an html file named as pizza-order.html
 - Add appropriate html elements and images as illustrated in the web page shown above to set up the content of your web page
 - use buttons or auto-slide that changes based on the selected pizza and a tooltip or hover effect over pizza names that displays a brief description.
 - Create an external .css file and call it as pizza-order.css
 - Link pizza-order.css to pizza-order.html to get the intended results

2. Use appropriate CSS elements and css selectors
3. Style the price calculation box to update in real time with a glowing effect when the price changes.
4. Create an external .js file and call it pizza-order.js
5. Link pizza-order.js file to pizza-order.html file and make sure to implement the appropriate functions to achieve following
 - When the user selects one or more pizzas,the price is calculated.Use prices in the form as an indication to calculate the total price accordingly.Once the pizza is selected,the total price must appear in the TotalPrice textbox.Moreover,if the user deselects a pizza item, the price is deducted accordingly
 - Similarly if the user decided to select or deselect extra toppings,the price is increased and deducted based on the values illustrated in the above web page
 - If the user selects the pick-up option,no extra charge is added, however at home delivery will add dollar(\$5) to the total price
 - Apply a discount code feature which allows Users can enter a discount code (e.g., DISCOUNT10) to apply a 10% discount on the total price and If the code is invalid, display an error message.
 - Display a warning message if no pizza is selected but the user tries to place an order
 - Create an appropriate scenario for HTML dom in above given page
 - Use appropriate event listeners and query selectors to above web page
6. Create an external .php file and call it pizza-order-processing.php
 - When the form is filled and automatically validated and once the user clicks on place order button,the form is processed in the server side in such a way that
 - If the form is valid the user input is sent to server
 - An order receipt is issued and sent back to user in the form of HTML web page.
 - An order receipt should have a breakdown of selected pizzas, toppings, and delivery option as well as the total price with any discounts applied.
 - In your implementation the following output must be shown

Dear John

We have received following order from you

6-inch pizza vegetarian

12-inch pizza Margherita

6-inch pizza Bufalo

With the following extra toppings

Mozzarella cheese

Total price is \$41

Thankyou from ordering from us

We will be on your way soon
