

Finding suitable presentation- environment

Ms. Iqra Shahzad, Department of Software Engineering ,
NUML ,Islamabad

Envisionment in practice

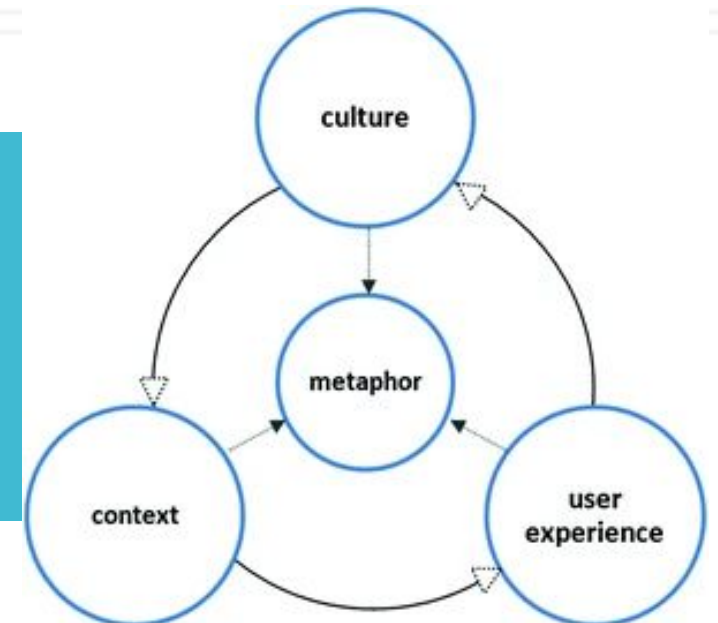

- At least two designers
- Should have some context
- Discussion when appropriate
- Lo-fi prototypes are preferable

- Generation, communication, and evaluation of ideas
- Which technique is used?
 - ▣ The working style
 - ▣ The type of project
 - ▣ The resources available
 - ▣ The skills of a designer
- Representation should be
 - ▣ Accurate enough to reflect the system features
 - ▣ Simple enough to avoid confusion

- Review requirements and conceptual scenarios
- Develop representations of your design ideas
 - ▣ If product is a new one, experiment with different metaphors
 - ▣ Explore design ideas with users
- If possible, document design decisions (claims analysis)
- Reconsider requirements in the light of developing design

Envisionment Process

Sketches and Snapshots

- All designers should practice it
- Ideas and thoughts are visualized and explored
- Millennium bridge was first designed on a paper napkin in restaurant
- Designers should have sketch book

ORDER

PRINT

DISCARD

**Extreme long shot
(wide shot)**

A view showing details of the setting, location, etc.

Long shot

Showing the full height of a person.

Medium shot

Shows a person's head and shoulders.

Over-the-shoulder shot

Looking over the shoulder of a person.

**Point of view shot
(POV)**

Seeing everything that a person sees themselves.

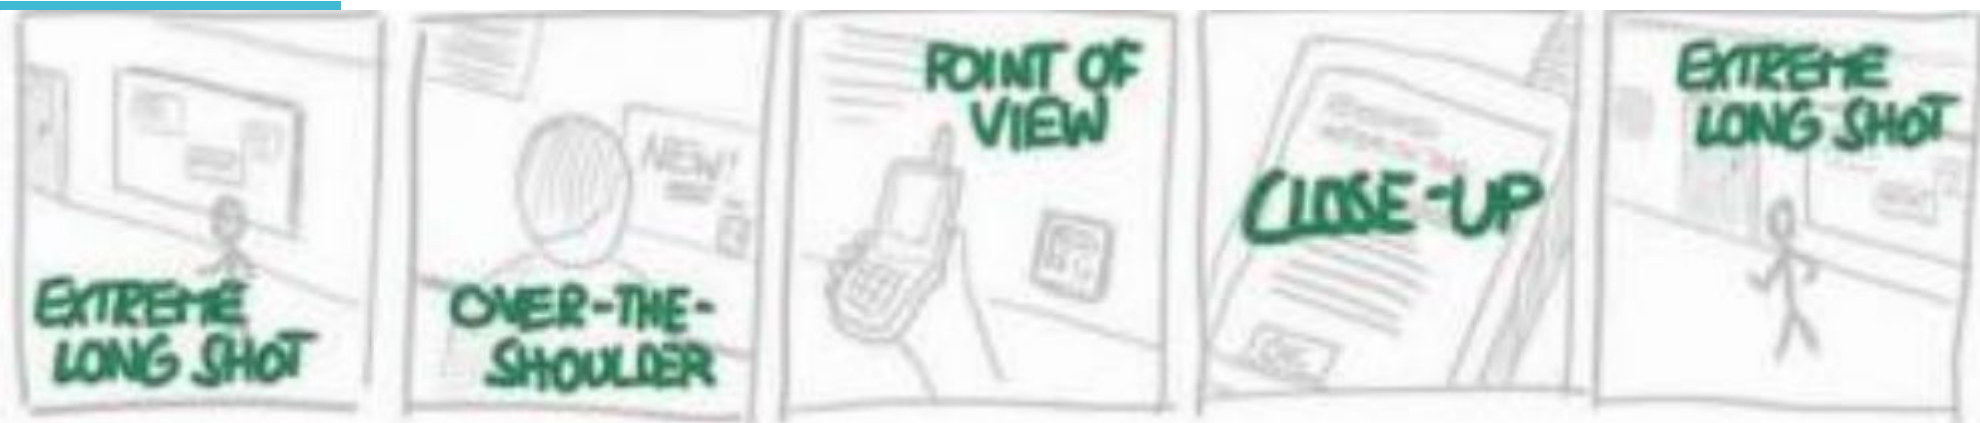

Close-up

such as showing details of a user interface a device the person is holding.

Storyboards

- Originated from filmmaking
- Cartoon-like structures
- Key moments are presented
- Feel the 'flow' of experience
- Economical; 6-8 scenes on a page
- Based on the concrete scenarios

1. Person passing by an advertisement board

2. Notices an advertisement and is interested in more information

3. Taking a photo of a barcode on the poster

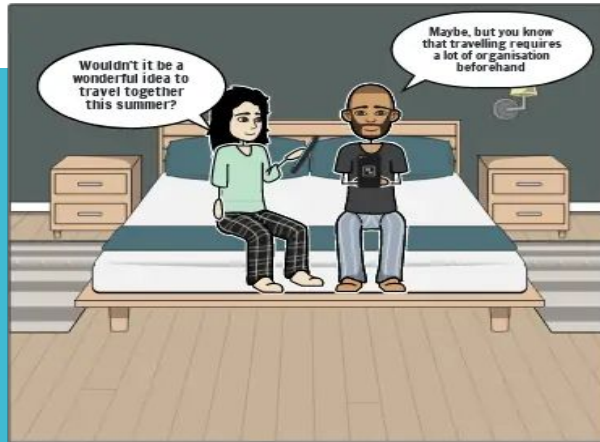

4. The mobile phone downloads detailed information about the new product

5. The person picks up the phone and turns around

Inspiration

Before going to sleep, Anna shows her husband some photos she saw from the place she really wants to visit.

Planning

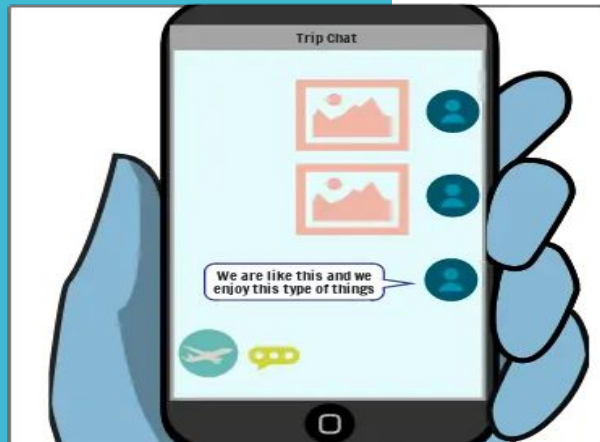

Between jumping through different apps to research on things to do, flight and hotel prices, building a budget and itinerary, Anna feels overwhelmed by planning and wishes there was a way to simplify things.

Coordination

Next day at work, Anna found an agency that, depending on the interests of the group/person, organises a trip according to their previously known tastes. Meanwhile, she is the doing the form for the future search for the perfect itinerary

Initiation

Anna starts to send attractions that she found to her travel group chat, which gets her friends more excited and involved about the trip.

Finalizing

One week before the trip, Anna, her husband already had everything organised. Places to go, places to visit, activities to do. They even had a meeting with another couple with the same interests.

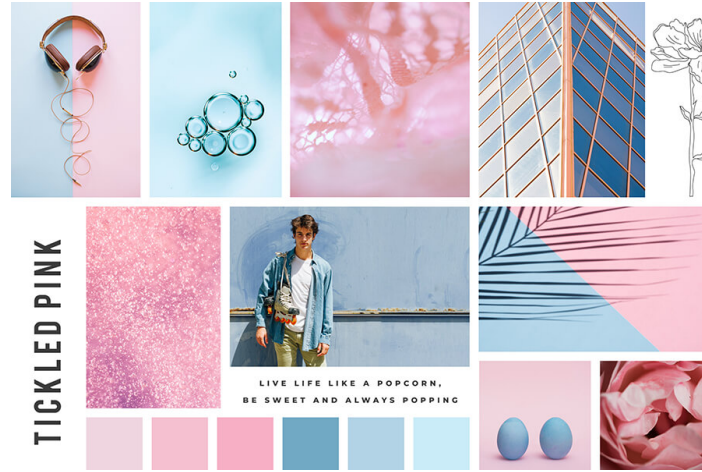

The day of the trip

Anna showing her friend the memory notebook made by the agency with the images and memories of the trip she had

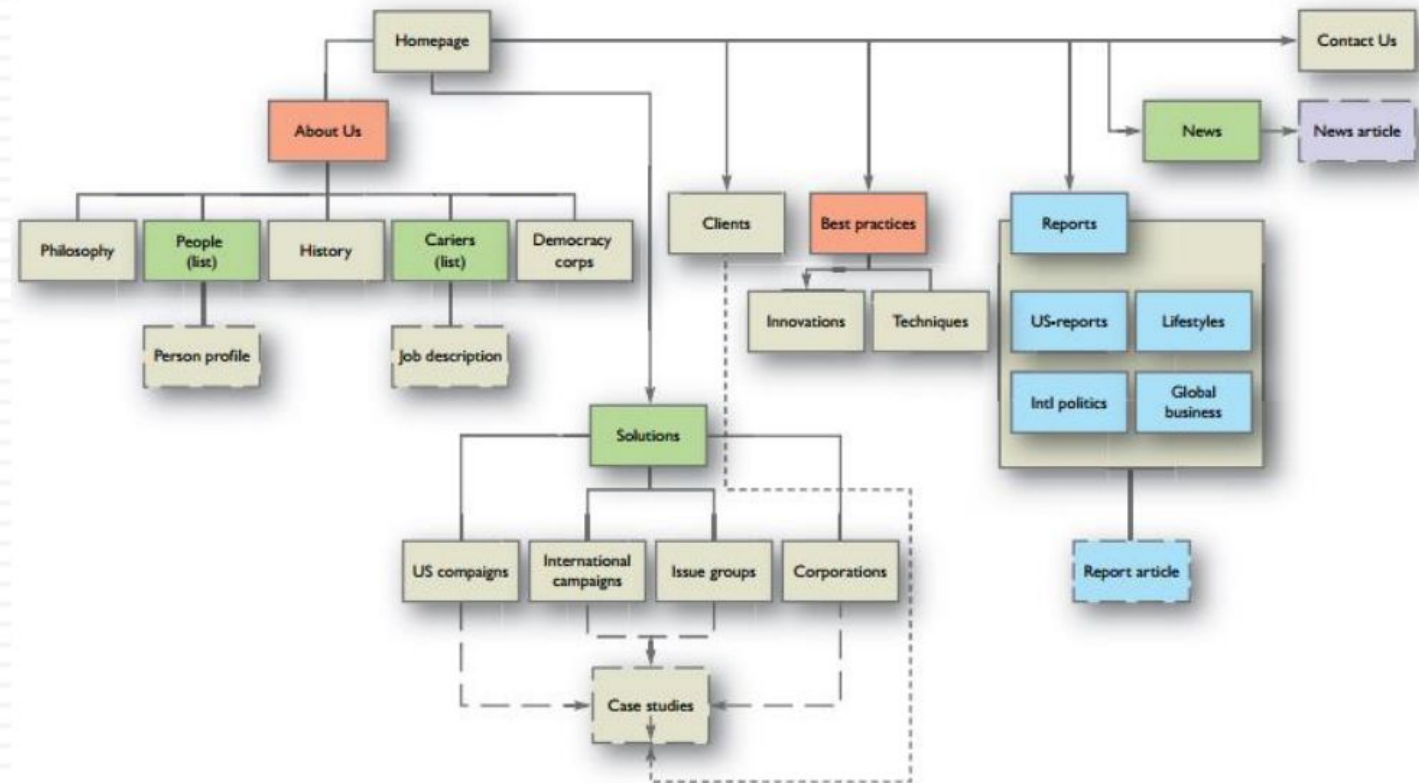

Mood boards

- a moodboard is a picture that shows how the product should look, feel, and act.
- It's usually a mix of pictures, colors, textures, patterns, fonts, and other visual elements that capture the essence of the product's personality and make people feel or think of things in a certain way.
- This keeps the product's vibe consistent across all its marketing stuff.

Navigation maps

- ❑ Movement through the site or application
- ❑ How people will experience it
- ❑ Page is represented with box or heading
- ❑ Put all possible flows (back and forwards)
- ❑ Easily re-drawn
- ❑ Poor navigation is one of the main reasons to turn off a website
- ❑ It helps to identify 'orphan pages'

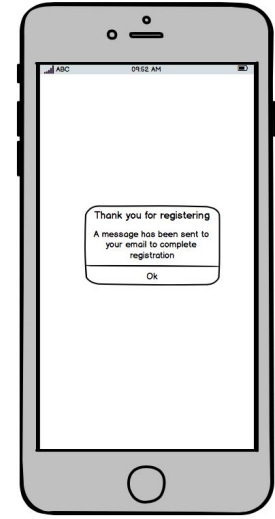

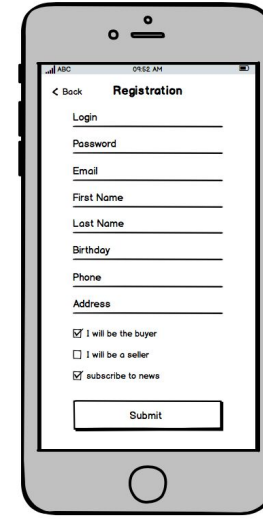

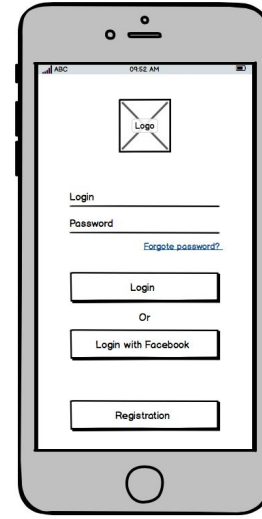

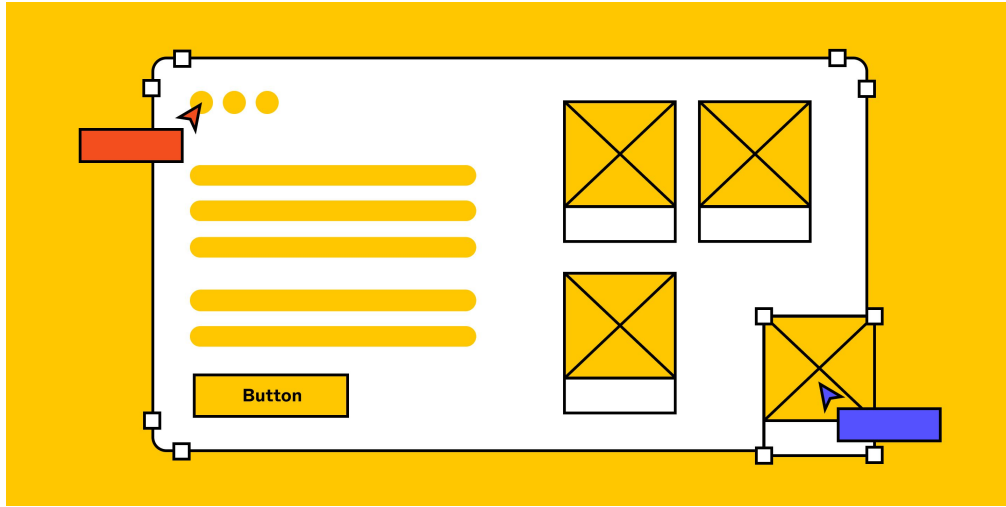

Wire frames

Wireframes are basic blueprints that help teams align on requirements, keeping UX design focused and constructive.

Think of your wireframe as the skeleton of final product components, and features, including:

- Screen layouts
 - Navigation bars
 - Components of UX and UI design
 - Interactive elements
- Outlines the structures of a software system
 - Focus on the general elements of a design
 - Certain events cause certain behaviors

prototype

Prototype

A **prototype** is not the actual product that is ready for the prime time and certainly not something the company would try to sell and stand behind. But it is intended to **learn fast and cheap.**

Types of prototypes

- **Paper prototypes**
- **Low fi prototypes**
- **High fi prototypes**
- **User driven prototypes**

Paper prototype

- Paper prototyping apps and websites is a method some design teams use to begin conceptualizing a new product or feature.
- This method involves sketching a quick outline of your product and its different screens, UI layouts and elements.
- It's a fast and cheap way to get ideas down on paper so that you can communicate them to your team and other stakeholders.
- For this reason, the paper prototyping methodology is also brilliant for brainstorming and ideation sessions.

Low-fidelity prototypes

- a low-fidelity prototype is the crucial foundation that the majority of the product's design will be built around.
- The low-fidelity prototyping methodology consists of quickly designing a digital outline of your screen's UI consisting of various elements on the screen along with basic content.
- It cuts out distraction by focusing on only the fundamental details, such as layout, spacing, element positioning, screen flow and information architecture.

**Are we getting users to design
our prototypes now while we
just sit back and relax? No,
definitely not.**

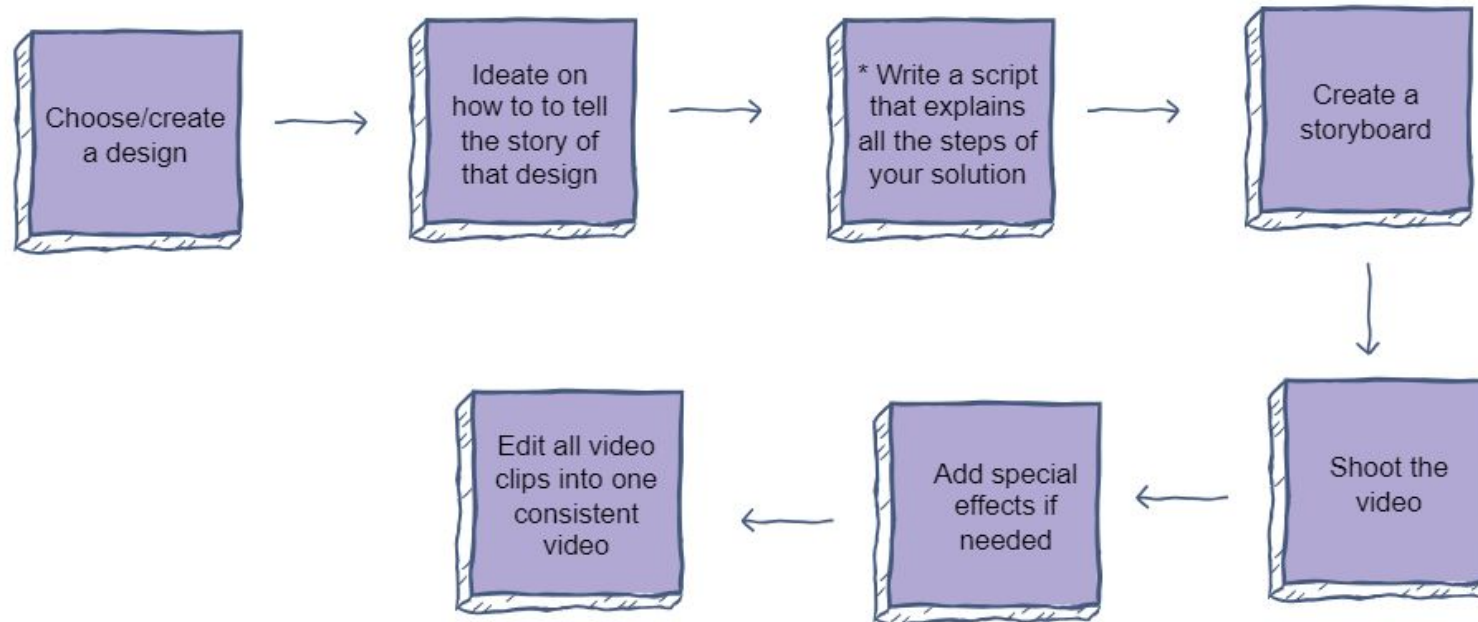

The user-driven prototyping methodology is merely an exercise where you sit down with a user and ask them to draw out how they expect a UI to look or a feature to work.

With this prototyping method, you're not getting them to design the product, instead, you're analyzing their sketches to understand their thought processes.

Video prototype:

- Use video to illustrate how users will interact with a new system. The goal is to refine a single system concept, making design choices that highlight and explore a particular design path.
- **Video prototypes are organized as scenarios that illustrate how people might interact with a future technology in a realistic setting.**
- The focus should be on helping designers to consider the details of how users will react to and control new technology in the context in which it will be used.

Video prototyping is used by interaction designers to tell a story about a design. Video prototyping allows people to connect with the design as they would in real life. It shows the entire experience through a narrative. Moreover, video prototyping allows all the stakeholders - users, developers, buyers, etc. - to understand the design better.

video prototyping tools

- video prototyping tools can be divided into categories based on the level of fidelity and functionality they offer. **Low-fidelity tools**, such as paper and pencil, whiteboard, or PowerPoint, allow users to create simple and rough sketches of their video idea with basic shapes, colors, and text; these are useful for brainstorming, ideating, and communicating the core concept and flow of a video.
- **High-fidelity tools** like Adobe After Effects, Principle, or InVision Studio enable users to create fully functional and interactive simulations of their video idea with animations, transitions, sounds, and user inputs; these are excellent for testing the usability, performance, and feedback of a video.
