

1. Visual Designing

- Focuses on aesthetics and usability.
- Includes color theory, contrast, white space, imagery, and consistency.
- A well-designed interface enhances user engagement and interaction.

2. Typography

- The art of arranging text to make it readable and visually appealing.
- Includes font selection, size, line spacing, letter spacing, and hierarchy.
- Serif fonts (e.g., Times New Roman) are more traditional, while sans-serif fonts (e.g., Roboto, Open Sans) are modern and readable on screens.

3. Grids and Alignment

- Grids help maintain **consistency and structure** in design.
- Common grid layouts: **12-column grid**, **8-point grid**, **modular grid**.
- Alignment (left, center, right, justified) ensures a clean and professional look.

Grids: A grid is a structure consisting of invisible lines that help align and position elements like text, images, or buttons. These grids can have columns of equal or varying widths, separated by "gutters" (the whitespace between columns).

Alignment: Alignment refers to how elements are arranged in relation to each other

4. Reading and Navigation

- Focuses on how users consume and move through content.
- **F-pattern** and **Z-pattern** are common reading patterns.
- Clear headings, bullet points, and whitespace improve readability.
- Navigation should be **intuitive**, with clear menus, buttons, and links.
