Assignment # __02__

Subject: __IICT__

Submitted to: Sir Talal Bin Afzal

Submitted by: Zulqarnain Hassan (Roll #NUML-S22-15676)

Class:BSSE-1-Afternoon

Section: __A__

assignment # 02

Question No 1:

What is the installed and mounted component of the motherboard, and which component is better in performance?

Installed components:

Installed components are all of those components which are already installed on the motherboard, and we can insert and remove the installed component.

Installed components are:

- CPU chip
- Hard disk
- GPU chip
- RAM
- Video card
- Audio card
- PCI slot
- CPU Fan and Heatsink

Mounted components:

Mounted components are all of those components which are already installed on the motherboard, and we cannot insert and remove the mounted component.

Mounted components are:

- CPU Fan and Heatsink Mount
- 24-pin ATX power connector
- IDE Connector
- SATA Connector
- COMS Backup Battery
- PCI Express Slot
- AGP slots

Performance:

The performance of mounted components is faster, reliable, and efficient.

Question no 2:

What is directly and indirectly installed components? Which components are directly or indirectly installed components? Which one is better in performance?

Directly Installed Components:

Directly installed components are those which are already installed on the motherboard. Like RAM which is directly installed on it.

Example:

- RAM
- Hard disk
- Video card
- CPU
- GPU

Indirectly Installed Components:

Indirectly components are installed on the motherboard by means of directly installed components.

Example:

- USB
- Keyboard
- Mouse
- ROM

Performance:

Directly components are better in performance as compared to indirect components. Because they are directly installed on the motherboard so they work faster as compared to indirect components.
